

CLEAR CONDITIONING DETERGENT COMPOSITIONS AND METHODS
FOR MAKING THE SAME

This application is a continuation-in-part of
5 U.S. patent application serial number _____ [number
will be commonly assigned, Attorney Docket No. D-
3022], filed November 7, 2001, the disclosure of which
is incorporated in its entirety herein by reference.

10 Background of the Invention

The concept of cleansing and conditioning
detergent products has drawn great attention since its
launch in the early 1980's. From a technical point,
cleansing and conditioning are contradictions, since
15 conditioning has to deposit some ingredients on an
object and cleansing has to remove the deposited
ingredients from the object. To combine cleansing and
conditioning in detergent products means when the
product removes the dirt from the object, the product
20 also simultaneously deposits some conditioning
ingredients on the object. The conditioning effects
depend on the equilibrium between the removed dirt,
conditioning ingredient and deposit conditioning
ingredients. For hair products, conditioning involves
25 depositing certain agents onto the hair to give it the
protection, softness, shine and detangling effects.
Less deposition means less conditioning and more
deposition means more conditioning or over
conditioning.

30 To achieve proper conditioning formulations,
chemists are faced with the challenge of choosing the
appropriate conditioning ingredients, the proper ratio
of conditioning ingredients to surfactants and methods
of incorporating conditioning ingredients into the
35 detergent system to form stable products.

A conditioning ingredient should have the basic
characteristic of being water-insoluble, easy to be
spread and have some affinities with the application
objects. Polysiloxane, such as dimethicone, and

derivatives are water-insoluble and are widely used conditioning ingredients. Furthermore, polysiloxanes usually give good hair protection, softening, shine and detangling effects.

5 The various technical methods for incorporating polysiloxanes, such as dimethicone, into the deterative products have been patented. The focus is on the particle size distribution of dimethicone surfactant emulsion and stability of the shampoo. Smaller
10 particle size means more stability and more deposition to the targeted object.

10022042-131701
15 Although some success has been achieved in being able to incorporate polysiloxanes, such as dimethicones, into deterative compositions, other challenges still remain. It remains a challenge to be able to formulate a stable conditioning/deterative composition, especially when a polysiloxane (e.g. dimethicone) is employed. Considering the regular viscosity of the deterative composition and the
20 relatively lightweight of the conditioning ingredients, it is very difficult to achieve a long-term stability of the products. For example, the products tend to separate with the conditioning ingredients settling on top of the water-detergent
25 solution. Furthermore, it remains a challenge to be able to formulate a clear stable conditioning/deterative composition, especially when the conditioning ingredient is a polysiloxane.

30 There continues to be a need to have a more stable formulation having a conditioner and a deterative composition. In particular, there is a need to have a clear deterative formulation which comprises a polysiloxane.

35 Summary of the Invention

 The present invention meets this need and provides for a stable, clear deterative composition having a polysiloxane component. In one embodiment,

the present invention provides for a clear deterative composition comprising a conditioner. A clear conditioning/deterative composition includes, for example, a conditioning shampoo which is substantially clear.

The term "clear" as used herein means a substantial amount of light may pass through. Alternatively, the term "clear" means transparent or translucent, as opposed to opaque.

In accordance with the invention, a composition comprising an emulsifier component and a polysiloxane component is provided. The polysiloxane component comprises at least one side chain component A having the general formula:

R1 is an H, OH or a C1-C5 hydrocarbon; X is a C1-C10 hydrocarbon, a heteroatom or

Z is a heteroatom and d is 0 to about 6.

Further in accordance with the present invention, the composition further comprises a deterative component. For example, the composition comprises about 5% to about 60% of the deterative component,

about 0.01% to about 10% of the emulsifier component, and about 0.01% to about 10% of the polysiloxane component.

Still further in accordance with the present invention, a method of making a clear shampoo is provided. The method comprises the steps of forming a micro-emulsion of a polysiloxane component, and combining the micro-emulsion with a deterative component. The micro-emulsion is formed by combining a non-ionic emulsifier with a polysiloxane component.

Any feature or combination of features described herein are included within the scope of the present invention provided that the features included in any such combination are not mutually inconsistent as will be apparent from the context, this specification, and the knowledge of one of ordinary skill in the art.

Additional advantages and aspects of the present invention are apparent in the following detailed description and claims.

Detailed Description of the Invention

The present invention is, in part, based upon the surprising discovery that a polysiloxane component may be combined with a deterative component to form a clear composition, preferably a clear shampoo. In a broad embodiment, the composition comprises an emulsifier component and a polysiloxane component.

Without wishing to limit the invention to any theory or mechanism of operation, it is believed that a clear composition, for example a clear shampoo composition, may be produced by combining a deterative component with a preformed micro emulsions comprising a polysiloxane component. The micro emulsions may or may not remain intact after it is combined with a deterative component.

In one embodiment, a composition of the present invention remains stable (for example remain clear) for about 360 days after manufacturing.

5

10022042-121701

Sub
C'

In one embodiment, the micro emulsions are formed by mixing the emulsifier components with the polysiloxane components, preferably in the presence of water. For example, micro emulsions are formed by homogenizing emulsifier components with polysiloxane components in a tank at about 40 to about 70 degrees C. In one embodiment, a homogenizer employed is model number ME 100 LC by Charles Ross and Son, Hauppauga, NY. In one embodiment, the ratio (by weight) of the emulsifier component to the polysiloxane component in a micro emulsion is about 1:1, 1:2, 1:3, or 1:4.

In one embodiment, emulsifier components include a non-ionic emulsifier. In another embodiment, the emulsifier components include a non-ionic emulsifier and at least one of an anionic emulsifier and an amphoteric emulsifier. The anionic amphoteric emulsifiers are selected from the anionic and amphoteric surfactants, respectively.

Non-limiting examples of non-ionic surfactants include: Capryleth-n, where n=4, 5; Deceth-n, where n=3, 4, 5, 6, 8, 9, 10; Undeceth-n, where n=3, 5, 7, 8, 9, 11; Coceth-n, where n=3, 5, 7, 8, 10; C9-11 Pareth-n, where n= 5, 6, 8; C9-15 Pareth-8; C11-15 Pareth-n, where n=3, 5, 9, 12, 15, 20, 30, 40; C11-21-Pareth-n, where n=3, 10; C12-1-n, where n=3, 5, 7, 9, 12; C12-14 Pareth-n, where n=5, 7, 9, 12; C12-15 Pareth-n, where n=2, 3, 4, 5, 7, 9, 10, 11, 12; C12-16 Pareth-n, where n=5, 7, 9; C14-15 Pareth-n, where n=4, 7, 8, 11, 12, 13; C20-22 Pareth-30; C20-40 Pareth-n, where n=3, 10, 24, 40; C22-24 Pareth-33; C30-50 Pareth-n, where n=3, 10, 40; C40-60 Pareth-n, where n=3, 10; C12-14 Sec-Pareth-5; C12-14 Sec-Pareth-n, where n=8, 9, 15, 20, 30, 40, 50; C11-15 Sec-Pareth-12; Dihydrocholeth-n, n=15, 20, 30; Glycereth-n, where n=7, 12, 20, 26, 31; Hydrogenated Talloweth-n, where

15 In one embodiment, the composition comprises
 about 0.01% to about 10% of an emulsifier component,
 preferably about 0.01% to about 8%, more preferably
 0.1% to about 5%, even more preferably 0.1% to about
 5%. Preferably, the emulsifier components form micro
 20 emulsions with the polysiloxane components.

In one embodiment, the composition comprises
 about 0.01% to about 10% of a non-ionic emulsifier,
 preferably about 0.01% to about 8%, more preferably
 0.1% to about 5%, even more preferably 0.1% to about
 25 5%. Preferably, the emulsifier components form micro
 emulsions with the polysiloxane components.

In one embodiment, the composition comprises
 about 0.01% to about 5% of a non-ionic emulsifier and
 at least one of about 0.1% to about 5% of an anionic
 30 emulsifier/surfactant and an amphoteric
 emulsifier/surfactant.

In one embodiment, the composition comprises
 about 0.01% to about 10% of a polysiloxane component.
 Preferably, the composition comprises about .05% to

about 6%, more preferably about 0.10% to about 5% of the polysiloxane component.

The popularity of polysiloxane, or dimethicone and dimethicone derivatives, in shampoo compositions originate from their chemical and physical properties. There is a weak inter-molecular interaction between polysiloxane molecules and continuing rotation around Si—C and Si—O bonds of the polysiloxane molecules because of the longer Si—C and Si—O than C—C and C—O in regular organic compound. Thus, there is much more space around the silicon atoms and therefore render the polysiloxane excellent spreadability. Polysiloxane and derivatives also have high refractive index. Furthermore, polysiloxane and derivatives can deliver a smooth feel, detangling and sheen effect to hair.

In one embodiment, the polysiloxane component has the general formula:

wherein a, b and c are independently 0 to about 1000, preferably 0 to about 500, more preferably 0 to about 100. "s.c.c." as used herein means side chain component. A side chain component is any atom, molecule, polymer or chemical entity which may be covalently attached to the Si of the polysiloxane component. For example, one side chain component may be a hydrocarbon, for example a C1-C10 hydrocarbon or

a hydroxide, and another side chain component on the same polysiloxane component may be a hydroxide

In a preferred embodiment, the polysiloxane component has the general formula:

10

wherein a, b and c are independently 0 to about 50.

In a preferred embodiment, the polysiloxane component comprises about 2 to about 1000 Si, preferably about 4 to about 500 Si, more preferably about 10 to about 300 Si.

In one embodiment, the polysiloxane component comprises at least one side chain component A having the general formula:

25

R₁ is an H or a C₁-C₅ hydrocarbon, and X is a C₁-C₁₀ hydrocarbon, a heteroatom or

wherein Z is a heteroatom and d is 0 to about 6. Non-limiting examples of heteroatoms useful in this invention includes N, O, S and P. In a preferred embodiment, Z is O (oxygen) and d is about 3.

In one embodiment, the cyclic moiety of the side chain component is saturated. In another embodiment, the cyclic moiety is substituted. For example, the a
 5 side chain component A of the polysiloxane component may include the general formula:

15 wherein R1, R2, R3, R4, R5, R6, R7, R8 and R9 are independently an H, a C1-C10 hydrocarbon, an ester, carboxyl or a halogen, and X is a C1-C10 hydrocarbon, a heteroatom or

wherein Z is a heteroatom and d is 0 to about 6.
 25 Preferably, X is a C1-C5 hydrocarbon or a heteroatom. In one embodiment, X is a heteroatom selected from the group consisting of N, O, Si, P, and S. In a preferred embodiment, R1, R4, R5, R6 and R7 are H's and R2, R3, R8 and R9 are C1 alkyls. Also, in a
 30 preferred embodiment, the cyclic moiety is a 5 or 6 member ring.

For example, a side chain component A of a preferred polysiloxane component of this invention has the general formula:

Side chain component A employed in accordance with this invention preferably has a "hindered amine", or a secondary restricted monoamine function group. Preferably, the molecules can be partially protonated at normal shampoo pH range (pH 4-7). The hindered amine functional group is believed to render several beneficial effects. For example, it is believed that the hindered amine polysiloxane (or dimethicone) has more hair or skin affinity and give more conditioning effects. Furthermore, a shampoo comprising a polysiloxane component with a hindered amine functional group is more stable gives more hair softness, smoothness and shine than a shampoo which does not have a hindered amine group.

In one embodiment, the ratio of the Si to the side chain component A in a polysiloxane component is 1:1, preferably 1:0.1, more preferably 1:0.01, even more preferably 1:0.001.

In one embodiment, every other Si of the polysiloxane component has a side chain component A. In another embodiment, every third Si has the side chain component A. In yet another embodiment, every fourth, fifth or sixth Si has a side chain component A.

In one embodiment, a polysiloxane component comprises a set of adjacent Si's of the polysiloxane component having side chain component A followed by a set of adjacent Si's having side chain components

which are not side chain component A. See, for example, the molecule M below:

wherein m and n are independently 0 to about 200. See also the molecules identified at www.nicnas.gov.au/publications/CAR/new/NA/NAFULLR/NA0800FR/NA819FR.pdf as of November 30, 2001, the disclosure of which is incorporated in its entirety herein by reference. In a preferred embodiment, the polysiloxane component comprises propoxytetramethyl piperidiny dimethicone. Preferably, the propoxytetramethyl piperidiny dimethicone has a molecular weight of about 10,000 to about 100,000.

In one embodiment, the polysiloxane component has a viscosity in the range of about 1 cps (centistoke) to about 1,000,000 cps (centistoke). Preferably, the polysiloxane component has a viscosity in the range of about 100 cps to about 500,000 cps. More preferably, the polysiloxane component has a viscosity in the range of about 1,000 cps to about 100,000 cps. For example, the polysiloxane component may have a viscosity of about 3,000 cps to about 4,000 cps, preferably about 3,500 cps.

In one embodiment, the polysiloxane component has a viscosity in the range of less than about 1,000,000 cps (centistoke). Preferably, the polysiloxane

component has a viscosity of less than about 500,000 cps. More preferably, the polysiloxane component has a viscosity of less than about 100,000 cps. Even more preferably, the polysiloxane component has a viscosity
5 of less than about 10,000 cps.

In one embodiment, the polysiloxane component has a viscosity in the range of more than about 1 cps (centistoke). Preferably, the polysiloxane component has a viscosity of more than about 1,000 cps. More
10 preferably, the polysiloxane component has a viscosity of more than about 3,000 cps. Even more preferably, the polysiloxane component has a viscosity of more than about 10,000 cps.

The amine contents of the polysiloxane components
15 vary with viscosity. The particular value of amine content corresponding to a certain range of viscosity may be determined readily by one of ordinary skill in the art. The amine content of the polysiloxane component may be about 200 to about 40,000 (ppm, N) at
20 about room temperature.

In one embodiment, the polysiloxane component comprises the molecule M and has a viscosity of about 500 to about 6,000 cps at room temperature. In a preferred embodiment, the polysiloxane component
25 comprises the molecule M and has a viscosity of about 1,000 to about 5,000 cps at room temperature. In a more preferred embodiment, the polysiloxane component comprises the molecule M and has a viscosity of about 2,000 to about 4,000 cps at room temperature. In an
30 even more preferred embodiment, the polysiloxane component comprises the molecule M and has a viscosity of about 3,000 to about 4,000 cps, for example about 3,500 cps at room temperature.

In one embodiment, the polysiloxane component is
35 water insoluble. In one embodiment, the polysiloxane component is a colorless, viscous liquid. In one embodiment, the shelf life of the polysiloxane is up to 12 months from date of manufacture.

In one embodiment, the composition comprises about 0.01% to about 10% of an emulsifier component and about 0.01% to about 10% of a polysiloxane component. In one embodiment, the emulsifier component is a mixture of non-ionic emulsifier and an anionic emulsifier (and/or amphoteric emulsifier). For example, the emulsifier component may comprise more than about 90%, more than about 80%, more than about 50%, more than about 30% or more than about 10% of non-ionic emulsifier.

Preferably, the emulsifier component and the polysiloxane component form a micro-emulsion. For example, an emulsifier component comprising an anionic emulsifier (e.g. Capryeth-3) and a non-ionic emulsifier (e.g. Undeceth-5) is added to propoxytetramethyl piperidiny dimethicone and water to form a micro-emulsion of propoxytetramethyl piperidiny dimethicone.

The mixture containing the micro-emulsion may be designated as "phase A". Phase A may be added to a deterative component, designated as "phase B", to form a clear composition. A deterative component comprises a chemical or formulation which is effective for cleaning, preferably cleaning hair. For example, the deterative component may comprise one or more of the anionic surfactants or amphoteric surfactants identified herein. In one embodiment, a deterative component may also include emulsifier components, for example the non-ionic emulsifiers above.

In one embodiment, the composition comprises about 5% to about 60% of the deterative component, preferably about 10% to about 50%, more preferably about 20% to about 40%, even more preferably about 20% to about 30%.

A deterative component may further comprise a shampoo additive component. Shampoo additive components include any chemical or formulation that adds to the beneficial qualities of a shampoo.

Shampoo additive components include, without limitation, ingredients for boosting foam, protecting the integrity of composition, increasing viscosity, covering the odor of raw material and increasing the attraction of the shampoo. Non-limiting examples of shampoo additive components include alkylamide MEA or alkylamide DEA, Sodium Chloride, preservatives, fragrance and colors.

In one embodiment, the composition comprises about 5% to about 60% (by weight) of the deterative component, 0.01% to about 10% (by weight) of the emulsifier component and about 0.01% to about 10% (by weight) of the polysiloxane component. Preferably, the polysiloxane component comprises a propoxytetramethyl piperidiny dimethicone.

In one embodiment, the ratio (by weight) of phase A:phase B is about 0.1:99.9, 1:99, 2:98.

We hereby incorporate the disclosures of Patent Nos. 5,540,952, 5,277,968 and 6,040,288 in their entirety by reference.

The invention is further illustrated by the following exemplar formulations, which are intended as illustrations only. The thermal and physical stabilities have been tested at both ambient and elevated (40°C) temperatures. Examples 1-7 are the clear deterative formulations. Examples 1-7 use the pre-emulsified microemulsion in the formula; therefore, it is easy to make stable and clear Propoxytetramethyl Piperidiny Dimethicone deterative emulsion. The composition is obtained by preparing phase A at 60-70 °C and incorporating silicone phase A into phase B at about 40-50 °C for clear deterative composition. The examples 8-11 are the opaque formulations and were made by directly dispersing the hindered amine silicone into surfactant system. The fragrance, preservatives and color are added and then

mixing at 40-50 °C afterwards. The pH for inventive
detersive composition should be within 4-7 pH ranges.
"q.s." means quantum sufficit, or as much as suffices.

Each of the percentages of the ingredients
5 identified in the Examples below may be individually
varied to be higher or lower by about 5% to about 40%,
preferably about 5% to about 20%, more preferably
about 5% to about 10%, and would still be considered
to be within the scope of this invention.

10 In each of the Examples below, the viscosity of
the identified polysiloxane component may be about 1
cps to about 1,000,000 cps (centistoke). For example,
the propoxytetramethyl piperidinyl dimethicone
(Molecule M) of Example 1 may be about 2,000 cps; the
15 propoxytetramethyl piperidinyl dimethicone (Molecule
M) of Example 2 may be about 3,000 cps; the
propoxytetramethyl piperidinyl dimethicone (Molecule
M) of Example 3 may be about 3,500 cps; the
propoxytetramethyl piperidinyl dimethicone (Molecule
20 M) of Example 4 may be about 4,000 cps; the
propoxytetramethyl piperidinyl dimethicone (Molecule
M) of Example 5 may be about 100,000 cps; the
propoxytetramethyl piperidinyl dimethicone (Molecule
M) of Example 6 may be about 200,000 cps; the
25 propoxytetramethyl piperidinyl dimethicone (Molecule
M) of Example 7 may be about 400,000 cps.
